Catty's Results

You've indicated that Catty very often or always has loose stool, but has pretty healthy skin. Catty's stool should be somewhat firm and have a distinct shape. Frequent loose stool is a sign of a digestive issue that may be caused by a problem with Catty's gut microbiome not functioning properly. The gut microbiome is the community of bacteria, viruses, and other microbes that live in Catty's digestive tract and is essential for health.

What's Next for Catty?

1

First, assess the microbiome.

A small stool sample can reveal a lot about your pet's health. Using DNA sequencing, we analyze the bacteria and compare it to our healthy cat reference set to determine if an imbalance is present. Then we provide recommendations to improve it. The different types of bacteria play different roles in the gut microbial community. When this community is out of balance or missing "good" bacteria, important digestive and immune functions may not be working properly. This imbalance can cause symptoms like diarrhea, vomiting, constipation, and even skin issues.

We recommend starting with a Gut Health Test to understand how Catty's microbiome is out of balance and which groups are problematic. Collecting a stool sample before you begin the Gut Restore Supplement will help us get to the root cause of Catty's digestive issues. Sometimes digestive issues can be solved with simple diet changes. The test results will provide dietary recommendations to promote the growth of beneficial bacteria in Catty's gut.

2

Next, restore the microbiome.

To help Catty right away, start a 30 day course of Gut Restore Supplements soon after you have collected a sample for microbiome testing. Give one capsule a day for 30 days.

Our supplement introduces an entire community of beneficial cat-specific bacteria to bring balance to the gut and relieve symptoms. Gut Restore is a fecal microbiota transplant (FMT) in an oral capsule. FMT is shown to improve symptoms in cats with chronic digestive problems.

Here's What Pet Parents Have To Say

A solution for her chronic diarrhea...

"I promised Margold I would find a solution to her chronic diarrhea. Within 3 days of starting the supplements, Margold regained control over her bowel movements. After one week, she was doing something she had almost never done since I had known her—she was having normal bowel movements."
- Tracy G.

They were very effective...

"Gizmo is about 11 years old and has been having issues since she was 4 years old - hairballs and associated digestive issues in the beginning then allergies and intolerances with increasing frequencies in the last years. I introduced her to the FMT capsules last year. They were very effective in managing digestive and motility issues which she has after the hairball season. Random rashes have completely stopped."
- Nolan B.

My cat got explosive diarrhea after a course of antibiotics. After 30 days of the KittyBiome he was back to normal stools. At the start of the treatment I emailed the company with a question. They were quick to respond and very helpful. I'm so glad I tried this and would definitely recommend it.

Thank you for creating such an amazing product! They have helped our sick rescues without killing their microbiome when we use them instead of traditional antibiotics that makes it harder for our rescues to recover faster. Those with gut health issues always respond much better and diarrhea issues are resolved faster. Keep doing what you're doing!

Miracle pills!

★★★★★ [Bonnie, 04 February, 2021]

My cat had been throwing up on a daily basis and was getting diarrhea. After a couple of weeks on the pills he has stopped throwing up completely and his stool is much improved. I am going to give him 60 pills to continue his good progress and I urge everyone to try this solution for their pet. Considering how expensive vet visits can be and the lack of results from them, this is definitely worth a try.

You've indicated that Milo **moderate to severe itchy skin**, and **very often or always has loose stool**. Milo's stool should be somewhat firm and have a distinct shape. Itchy skin and frequent loose stool are signs of a digestive issue that may be caused by a problem with Milo's gut microbiome not functioning properly. The gut microbiome is the community of bacteria, viruses, and other microbes that live in Milo's digestive tract and is essential for health.

Using DNA sequencing, we analyze the bacteria in your pet's poop and compare it to our healthy cat reference set to determine if an imbalance is present. We then provide a thorough report of Milo's microbiome and personalized recommendations to improve it.

Why is it so important to identify an imbalance? The different types of bacteria play different roles in the gut microbial community. When this community is out of balance or is missing key "good" bacteria, important digestive and immune functions may not perform properly. This can lead to symptoms like diarrhea, vomiting, constipation, and skin issues. If an imbalance is present the immune system may overreact to a threat by causing inflamed and itchy skin. Miracle pills!
★★★★★ [Bonnie, 04 February, 2021]

My cat had been throwing up on a daily basis and was getting diarrhea. After a couple of weeks on the pills he has stopped throwing up completely and his stool is much improved. I am going to give him 60 pills to continue his good progress and I urge everyone to try this solution for their pet. Considering how expensive vet visits can be and the lack of results from them, this is definitely worth a try.

Simba's Results

You've indicated that Simba **rarely or never** has loose stool, and he has **pretty healthy** skin. These are good signs that Simba's gut microbiome is healthy and we are here to help you keep it that way. The gut microbiome is the community of bacteria, viruses, and other microbes that live in Simba's digestive tract and is essential for health.

What's Next for Simba?

1

First, assess the microbiome.

A small stool sample can reveal a lot about your pet's health. The Gut Health Test will provide detailed insight into what is happening in Simba's microbiome and whether the gut bacteria are balanced or not.

Using DNA sequencing, we analyze the bacteria in your pet's poop and compare it to our healthy cat reference set to determine if an imbalance is present. We then provide a thorough report of Simba's microbiome and personalized recommendations to achieve optimal health.

Microbiome testing can detect imbalances before any symptoms occur. The different types of bacteria play different roles in the gut microbial community. There are many ways this community can become imbalanced. The earlier you catch a bacterial imbalance, the easier it is to address it.

2

Next, restore the microbiome.

If the results from Simba's Gut Health Test detect an imbalance in their gut microbiome and/or they are missing important 'good' bacteria, the test report provides personalized recommendations to address the imbalance(s).

For example, we may suggest dietary changes, such as adjusting macronutrients to support the growth of specific beneficial bacteria. Most minor gut imbalances can be improved with simple diet modifications.

Simba's Action Plan

We recommend our KittyBiome™ Gut Health Test (One Test), which will detect gut imbalances before symptoms occur and provide dietary recommendations to promote the growth of beneficial bacteria.

Here's What Pet Parents Have To Say

A solution for her chronic diarrhea...

"I promised Marigold I would find a solution to her chronic diarrhea. Within 3 days of starting the supplements, Marigold regained control over her bowel movements. After one week, she was doing something she had almost never done since I had known her—she was having normal bowel movements."

- Tracy G.

They were very effective...

"Gizmo is about 11 years old and has been having issues since she was 4 years old - hairballs and associated digestive issues in the beginning then allergies and intolerances with increasing frequencies in the last years. I introduced her to the FMT capsules last year. They were very effective in managing digestive and motility issues which she has after the hairball season. Random rashes have completely stopped."

My cat got explosive diarrhea after a course of antibiotics. After 30 days of the KittyBiome he was back to normal stools. At the start of the treatment I emailed the company with a question. They were quick to respond and very helpful. I'm so glad I tried this and would definitely recommend it.

Thank you for creating such an amazing product! They have helped our sick rescues without killing their microbiome when we use them instead of traditional antibiotics that makes it harder for our rescues to recover faster. Those with gut health issues always respond much better and diarrhea issues are resolved faster. Keep doing what you're doing!

Jack's Results

You've indicated that Jack **rarely or never** has loose stool, and he has **fairly healthy** skin with **mild itchiness**. Mild itchy skin may be caused by a problem with Jack's gut microbiome not functioning properly. The gut microbiome is the community of bacteria, viruses, and other microbes that live in Jack's digestive tract and is essential for health.

Why is it so important to identify an imbalance? The different types of bacteria play different roles in the gut microbial community. When this community is out of balance or is missing "good" bacteria, important digestive and immune functions may not be performed properly. This can lead to symptoms like diarrhea and itchy or inflamed skin. The earlier you catch a bacterial imbalance, the easier it is to address it.

Jack's Action Plan

We recommend our **KittyBiome™ Gut Health Test (One Test)** to determine if an imbalance is present. A gut health test will let you know if diet changes or other supplementation is appropriate to support Jack's health.

Lucy's Results

You've indicated that lucy has **moderate to severe itchy skin**, but has pretty **healthy stool**. lucy's itchy skin may be caused by a problem with his gut microbiome not functioning properly. The gut microbiome is the community of bacteria, viruses, and other microbes that live in lucy's digestive tract and is essential for health.

What's Next for Lucy?

First, assess the problem.

When the gut microbiome is out of balance, the immune system can overreact to a threat, which can result in symptoms such as inflamed and itchy skin. About 80% of immune cells reside in the gut, meaning the health of the gut microbial community plays a big role in the immune system.

A small stool sample can reveal a lot about your pet's health. Using DNA sequencing, we analyze the bacteria and compare it to our healthy cat reference set to determine if an imbalance is present. Then we provide recommendations to improve it.

Why is it so important to identify an imbalance? The different types of bacteria play different roles in the gut microbial community. When this community is out of balance or missing "good" bacteria, important immune functions may not be working properly. This imbalance can cause immune-related symptoms like itchiness, redness, saliva staining, hair loss, broken or thick skin, recurrent ear infections, and chin acne.

We recommend starting with a Gut Health Test to understand how Lucy's microbiome is out of balance and which groups are problematic. Collecting a stool sample before you begin the Gut Restore Supplement will help us get to the root cause(s) of Lucy's skin issues. Sometimes skin issues can be solved with simple diet changes. The test results will provide dietary recommendations to promote the growth of beneficial bacteria in Lucy's gut.

Next, restore the microbiome.

To help Lucy right away, start a 30 day course of Gut Restore Supplement soon after you have collected a sample for microbiome testing. Give one capsule a day for 30 days.

Our supplement introduces an entire community of beneficial cat-specific bacteria to bring balance to the gut and relieve symptoms. Gut Restore is a fecal microbiota transplant (FMT) in an oral capsule. FMT is shown to improve symptoms in cats with chronic skin problems and digestive issues.
